Jonatan Thorpe Plaza

SOFTWARE ENGINEER · APPLIED AI

Software engineer with hands-on experience in backend and full-stack development, passionate about bringing AI into real products. Most interested in choosing the right model for each business problem and making it run efficiently in production, not just in a demo. Comfortable working directly with clients to turn their needs into working software. Eager to join a team where I can learn and improve across full stack and AI.

- Málaga, Spain
- Open to relocating anywhere in Spain, the EU and the UK
- EU citizen

EDUCATION

BSc in Computer Engineering
University of Almería · 2021 - 2026
Software Engineering specialisation, with transformer and ViT theory applied in my final project.

Higher Technician in Multiplatform Application Development (DAM)
IES Los Montecillos · 2018 - 2020

Technician in Microcomputer Systems & Networks (SMR)
IES Gerald Brenan · 2016 - 2018

WORK EXPERIENCE

Junior Developer · Indra Producción Software
Jan 2021 - Oct 2021

Java 8 · Spring · Oracle 11 · Maven · GWT · JUnit5 · Mockito · PowerMockito · JBoss · Git · Scrum

- Worked in a Scrum team on Galileo, the European GNSS programme: a large multi-module system with strict reliability requirements.
- Built Java 8 backend features on Spring, Oracle 11 and Maven, plus their GWT screens.
- Wrote unit and integration tests (JUnit5, Mockito, PowerMockito), raising my module's coverage from **70% to over 95%** so it could be safely integrated into the system.
- Managed Oracle DBs: queries, code connection, table import/export, installs and upgrades.
- Helped deploy on JBoss, fixed code incidents and documented the project, using Git.

Web Application Developer · All Natura S.L.
Oct 2020 - Jan 2021

Odoo · HTML/CSS

- Designed and laid out the company website.
- Customised the company's Odoo CRM to fit how it worked.

Developer Intern · Star-Group
Apr 2020 - Jun 2020

C# · ASP.NET MVC · SQL Server · Scrum

- Built on my own a web application for a local English academy to manage its day-to-day activity, working in Scrum sprints with the team.

PROJECTS

Scannet · Final Degree Project
Sep 2025 - Jul 2026 · Completed

Python · PyTorch · LoRA/PEFT · Florence-2 · DeepSeek-OCR-2 · React · Supabase · Vercel · RunPod

Need: receipt data had to be typed in by hand.

Built: designed a pipeline where a fine-tuned VLM reads the receipt and OCR cross-checks its answer, training Florence-2 and DeepSeek-OCR-2 (LoRA) on a dataset I grew from **62 real receipts to 816 images** with data augmentation and labels distilled from a larger teacher model. The live React/Supabase app on Vercel runs OCR plus DeepSeek with total and NIF/CIF checks.

Result: iterated over **5 training rounds**, reviewing the errors on unseen receipts after each one to improve the next. Florence-2 got the exact total on **85.7%** of unseen receipts. DeepSeek-OCR-2 invented items while its validation loss fell, so production uses OCR plus an LLM, at **~€0.002 per receipt**.

Local: ran the 3.5B model on my AMD RX 6750 XT, which ROCm does not support on Windows, by swapping its CUDA calls for DirectML at runtime.

AI Order Automation
Feb 2025 - Present

Java · Spring Boot · React · MySQL · Meta WhatsApp Cloud API · DeepSeek · Whisper · JWT · Docker

Need: orders arrived as WhatsApp texts and voice notes and were typed up by hand.

Built: a Spring Boot service that reads its WhatsApp chats through Meta's Cloud API, transcribes voice notes with Whisper and has DeepSeek turn each message into a structured order, shown on a React dashboard.

Result: live since Aug 2026 on my own server: **1,600+ real messages** received, each saved ~10 ms after Meta's webhook, and 18 conversations processed with **0 errors**.

Self-hosted Portfolio · jonatanthorpe.dev
Jun 2026 - Present · Live

React 19 · Vite · nginx · Ubuntu VPS (Hetzner) · Let's Encrypt · GitHub Actions

Need: learn DevOps by running a real site in production myself.

Built: set up and hardened an Ubuntu VPS with nginx and Let's Encrypt TLS, with deployments automated through GitHub Actions.

Result: **Lighthouse 100** for accessibility and SEO, **SSL Labs grade A**, ~20 s deploys.

Job Search MCP Server
Jul 2026 - Present

TypeScript · Node · Model Context Protocol SDK · Zod · node:test

Need: give an LLM my evolving skills profile and job pipeline without pasting context by hand.

Built: an MCP server with Zod-typed tools over a Markdown vault that can only put on a CV what its JSON source contains, with unit tests and atomic writes.

Result: it has tracked **150+ job offers** and rendered **100+ tailored versions** of this CV.

More projects · jonatanthorpe.dev

Portfolio: case studies, source code and live deployments of the rest of my work.
